We are now able to deliver new capability at an unprecedented pace nationwide, alongside having the resilience that the most reliable network demands. So yeah, that's cool. Stochastic, Stochastic Petri Nets, you're bringing me back in time. DSP, I have to say, I've had the good fortune of being on this journey for those 10 years. But I wanted to say, Praveen, thank you so much for coming here and sharing that journey with all of us, with everyone here. Thanks. Thank you. Thank you very much. You guys have been instrumental and looking forward to the next step. All right. All right.

All right. Here is what I want you to take away from everything that you've just seen. Most enterprise AI platforms ask you to make a choice. You can have the power of Frontier models, or you can have control, governance, security, cost, visibility, data sovereignty. Red Hat AI doesn't force you to make that choice. Models as a service gives your teams the model access they need, any model, governed and guardrailed at a cost your finance team can understand and then agents as a service gives your organization the full power of agentic AI with the security posture your IT team can actually defend AI. Applications built on your data give you capabilities that your competitors simply cannot replicate because they don't have your data, they don't have your domain knowledge, they don't have your fine tuned models. And all of this runs on the same distributed inference infrastructure, the same security layer, governance controls and token economics model. This is what matters. When the AI market moves again, the enterprises we work with are already prepared for what's next, because they own the platform that it runs on. Red Hat AI is the enterprise AI strategy that compounds in your favor. Now heroes know that each new day brings new challenges. Some days you're refusing to let legacy black boxes define your future. Other days, you might be taking on the tough but necessary work of building the foundations that allow your teams to scale and on others. You're focused on the reality of AI work, ensuring that your organization can run on any model, on any accelerator, in any cloud and any agent without sacrificing your digital sovereignty. So have a great rest of your day at the product spotlights and at the breakout sessions, and we'll see you right back here tomorrow morning.
