What you'll walk away with

1. How ServiceNow LEAP and Red Hat Ansible connect AI-powered discovery to governed execution
2. Practical ServiceNow and Red Hat Ansible AIOps use cases you can implement today
3. How AIOps bridges the gap between automation and service management teams

Agenda

- > Red Hat Ansible + ServiceNow partnership overview
- > Common challenges for automation + service management teams
- > Red Hat Ansible's role in AIOps
- > ServiceNow LEAP overview
- > Practical AIOps use case
- > Demo
- > Outcomes with Red Hat Ansible + ServiceNow LEAP
- > Next steps

Overview

Red Hat Ansible for ServiceNow

Increase the value and efficiency of ServiceNow

- **Enable automation of ITSM / ITOM workflows;** open, close, update tickets automatically
- **Reduce ticketing noise** and manual intervention
- **Ensure accuracy** and establish your ServiceNow CMDB as a single-source-of-truth inventory source for compliance
- **Improve team productivity and system performance** through automated remediation to reduce MTTR
- **Boost efficiency with proactive response** to events in your infrastructure or in ServiceNow with the Event-Driven Ansible plug in
- **Maintain compliance** by integrating with ServiceNow ticketing to ensure traceability and audit support for automation

What do we mean by “AIOps”?

AIOps | Turn operational insight into
intelligent, automated outcomes.

Common challenges

Your automation and service management live in **different worlds**

Common challenges

Operational costs

Duplicating automation across platforms, wasting resources

Underutilized investments

Existing AAP assets sit isolated and unused, failing to deliver ROI within ServiceNow workflows

Slower incident resolution

Manual handoff between ServiceNow and IT infrastructure teams inflates MTTR

Trust barriers

AI can suggest but action must be governed, as production demands deterministic outcomes

Coordination

Siloed teams are managing resources separately with manual processes that are prone to error.

Red Hat Ansible overview

Red Hat Ansible Automation Platform

Govern, execute, and scale your AIOps

Accelerate incident response

Reduce MTTR by connecting AI insights to automated action and remediation

Produce consistent automation

Replace ad-hoc troubleshooting with pre-tested, repeatable playbooks that execute the same proven fix

Govern AI execution

AI recommends and executes automation within boundaries your team defines, governed by RBAC, approval gates, and a complete audit trail

Remediate across domains

Execute automation across network, cloud, Linux, Windows, containers, storage, and security from a single platform

Seamless integration with other mission-critical tools

Build and operate essential workflows across the open hybrid cloud ecosystem

Network

Operating systems

Cloud

Virtualization

Security

AIOps

Every workload you automate with AAP serves 3 critical roles

- ✓ Translation of operational SME into reusable, testable, and human readable code
- ✓ Documentation of approved process with an auditable trail
- ✓ Creation of a consistent, scalable and reliable policy enforcement mechanism

Your automation library

One security boundary, one audit trail, one source of truth

Your automation library is also your security boundary.

It should define what AI is - *and isn't* - allowed to do.

In the AI era, agents will need a "menu" of approved actions.

Your automation library IS that menu!

The more you automate, the better

All of your automation efforts today are going to pay off as you build for tomorrow

ServiceNow LEAP overview

ServiceNow LEAP

Automation Discovery with AI

Discover & match automation to incidents

Now LLMs and RAG categorize incidents by pattern, discover existing automation, and surface recommendations with confidence scores directly in the operator workflow

Generate LEAP resolution with NowAssist

AI to analyze historical incident datasets and generate automated resolution steps

Measure ROI from zero touch automation

Value dashboard tracks effectiveness and estimates savings, so teams know where to expand coverage next

Drive proactive problem management and AI generated knowledge base articles

Increase L1/L2 automation coverage, lower cost per ticket, and improve consistency across shifts

15% faster resolution 11% MTTR reduction 15% less employee time lost per incident

*Suggested improvements are based on Forrester Total Economic Impact Report, customer references, or ServiceNow telemetry data

ServiceNow LEAP

Incident deflection strategy with Knowledge base

AI Specialist to auto create knowledge base articles

18.6% of tickets closed by higher-tier support could have been resolved at Level 1 support specialist if proper KB articles had been used.

ServiceNow LEAP

Proactive problem management

VPN-related DNS resolution issues affecting connectivity

Number	Group type	Record count	Potential cost savings	Potential time savings	Automation priority	Status
AOPP0000522	Incident	27	\$2.7k/ month	2.8 days/ month	High	Steps generated

Resolution steps

Generated on 2026-01-08 09:53:45

1. Identify users experiencing DNS resolution issues while connected to the Cloud VPN, including failures, delays, or intermittency for internal or external domains.

2. Verify and compare DNS server settings and DNS caching configurations on affected VPN clients and devices.

3. Check for discrepancies, misconfigurations, or outdated DNS server addresses and forwarding rules in VPN, network, and client configurations.

4. Update DNS server addresses to reliable servers (e.g., internal DNS for internal domains, 8.8.8.8 for public), and correct DNS forwarding and caching settings as needed.

5. Save and apply all configuration changes, then flush DNS caches on servers and clients (e.g., Windows: ipconfig /flushdns; macOS: sudo dscacheutil -flushcache; sudo killall -HUP mDNSResponder).

6. Disconnect and reconnect VPN clients to apply new settings, ensuring correct DNS configuration is enforced.

7. Test DNS resolution for internal and external resources to confirm the issue is resolved.

Automation Opportunities

GenAI

Resolution Steps

AI Specialist to auto create problem records

Proactive problem management with AI shifts IT from “firefighting” to foresight by using LLM to detect patterns and resolve root causes before they become incidents.

ServiceNow LEAP with Red Hat Ansible

Drive zero service outage strategy

Active playbooks

Find relevant playbooks

Practical AIOps use case

Interaction interfaces with Ansible Automation Platform

Human interface
The WebUI enables operators to configure, launch, and monitor automation through a role-based interface.

Application interface
Token-based authentication enables third-party tools and services to securely integrate with the platform using OAuth 2.

Event interface
An EDA plugin connects Ansible to external event sources and triggers automation when defined conditions are met.

AI interface
An MCP server enables AI models to query Ansible Automation Platform and launch automation within defined boundaries.

AI interface

An MCP server enables AI models to query Ansible Automation Platform and launch automation within defined boundaries.

MCP

How it works: Automation discovery with Red Hat Ansible

Applying the fixes: Zero touch automation

DEMO

Value of ServiceNow LEAP and Red Hat Ansible

Value with Red Hat Ansible + ServiceNow LEAP

Resolve faster: Eliminate redundant troubleshooting and escalations to cut resolution times from hours to minutes

Reuse what you already built: LEAP surfaces existing AAP automation at the point of incident so teams stop reinventing fixes

Deliver consistent outcomes: Pre-tested playbooks produce the same result every time, regardless of who triggers them

Break down silos: Remove the visibility, skills, and trust barriers between automation and service management teams

Enforce governance at every step: Every action runs through RBAC, approval workflows, and a full audit trail

Key takeaways

Intelligence without execution is just a recommendation.

ServiceNow LEAP finds the right automation. Red Hat Ansible turns that recommendation into a governed, auditable outcome.

Stop reinventing what you've already automated.

ServiceNow LEAP discovers existing Ansible playbooks and surfaces them directly in the ServiceNow operator workflow. One click and no expertise required.

AIOps bridges the gap between automation and service management teams.

AI can connect teams, matching detected issues to existing remediation content in real time for both automation and service management teams.
