SUMMARY KEYWORDS

Red Hat Light Speed, agentic management, on-prem connectivity, operational intelligence, Red Hat Insights, AI leverage, system administrator, talent count, automation tools, vulnerability management, compliance capabilities, cost management, on-prem solutions, AI workflows, CrowdStrike partnership.

SPEAKERS

Speaker 4, Speaker 2, Speaker 3, Speaker 5, Speaker 1, Speaker 6

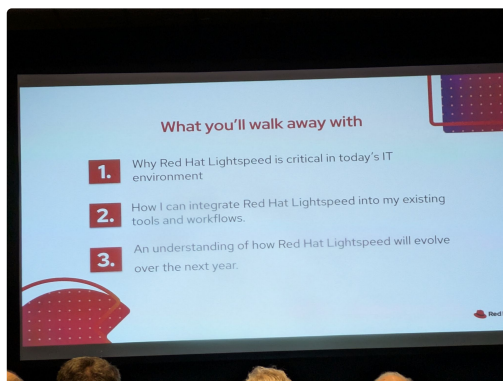

S Speaker 1 00:00
Hey

S Speaker 2 00:04
everyone. My name is Megan Tobin. Well, I'm on the product team for Red Hat light speed as well. Thanks for being here.

S

Speaker 3 00:10

All right, so over the next 30 minutes to do we will leave about 10 minutes again for question answers, if you have any. But we're gonna give you an overview next year where light speed is today, and also kind of drill into three themes that we have today, which is agentic management on prem connectivity and operational intelligence at scale that you'll see layered in throughout this before we get started. Is anybody going to write out I speed user today? How many of you are finding out about this for the first time? Okay, how many of you have known but just haven't been able to adopt it? So the first thing I just want to highlight, just so that we can get through a little bit confusion, is you may have heard of Red Hat Insights. Red Hat Insights is now we're going to have landscape as of this year. We did go through a rebrand, and really the purpose of this was to align our product with the evolution. When we launched insights several years back, we were really focused on just that. We were focused on insights. We were focused on just giving you those findings and servicing those findings. And really as we're trying to evolve both our tooling as well as well as our management capabilities. We're trying to move from this shift of just showing it's also then moving towards, how do we give you operational intelligence? How do we give you AI leverage management to help you identify, prioritize and resolve just also avoid any additional confusion. You may also hear other terms of light speed throughout this conference, you may have heard of a REL, light speed, open shift light speed. These are AI agents and AI capabilities that are embedded within those products. Those are a different area. Those are a different product, compared to Red Hat light speed, where Red Hat light speed is focused on your fleet of your Red Hat footprint, whether that's REL, open shift or Ansible you

S

Speaker 1 02:00

as well.

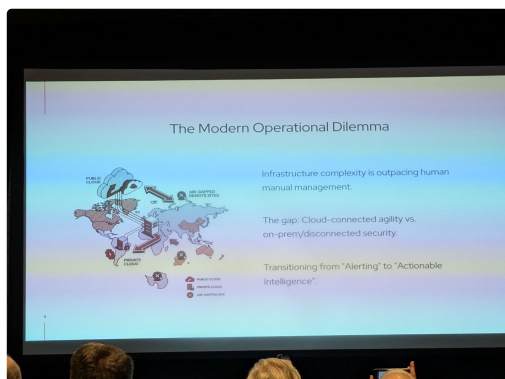

S

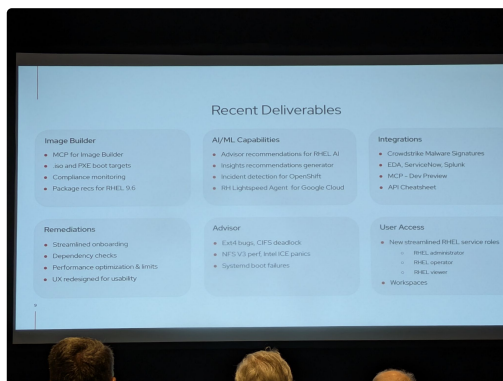

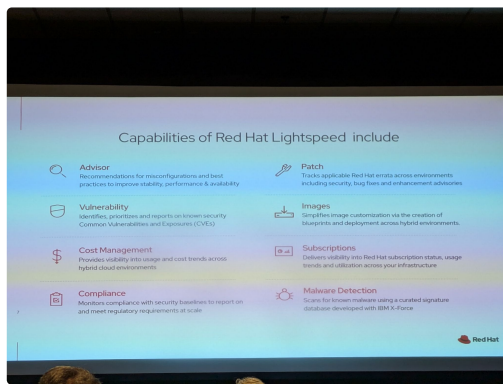

Speaker 3 02:03

So Ben and I, when we talk to a lot of our customers these days, we really see a lot of the same things. There's this moderate operational dilemma, which we are trying to help build management tooling to help you navigate this is really that problem we're building for. We understand that today's environments are getting more complex. We understand that those footprints are getting larger, whether that's on prem, whether that's the cloud, hybrid cloud, right, the scale of which these solutions that you're doing are getting larger. They're getting faster, and they're really having to keep up with the needs of the business. But if you think about your seasoned system administrator and how much time you're spending on the business needs versus all the toil that your organization is dealing with. This matches up to what the research is saying. Right? If you think of your seasoned system administrator, there's probably spending about 60% of the time on this toil, whether that's triaging, whether that's patching, whether that's keeping up and keeping the lights on, right, not really where we want them spending the time if we're trying to monetize services. We've also realized that these environments continue to explode. Like I said, that footprint is getting bigger, but so does that surface area for you to manage, for you to keep secure, you keep on, keep reliable. And what we're also finding is there's a talent count, right? 90% of businesses are saying that they are not able to keep up with where they want their business to be going because of purely a talent count, whether that's the talent of the infrastructure that they're having to manage, whether that's just purely personnel, right? And while budgets are shrinking, you saw that mentioned in today's keynote, it's not able to necessarily keep up with it, right? So we're getting to a point where we can't just throw more humans at this. We haven't been able to for a while, right? We're really focused on trying to keep those lights on. We need to put management, we need to put automation, we need to put tools. And so this is where we are trying to pivot from moving just from tools that are telling you what's wrong. Really, help you put this into action. Help you act on it. Move on it and get going faster. And really what you'll see throughout this, this whole roadmap, is this operational lifecycle that we build our tooling and our solution for, really around these three, these three stages, which is, identify, prioritize, resolve. When we're trying to build these, we're looking at it both in the individual runs as you might have a need specifically through that, whether that's the scope of your team. Might be working with multiple different teams to manage that, but light speed here is trying to help you minimize the time that takes you to go along that cycle. And so if you want to think about this as an additional digital senior architect on your team that can help you identify, prioritize and resolve, take it as an extra set of hands and just run has expertise on that in prioritization. This isn't necessarily what's wrong, right. You might already have a large landscape where you can't just identify that. You have 130 new CDs, right? Especially with AI at the in the hands of some of these attackers, the amount of great CDs that we're going to be seeing is going to be going up pretty astronomically, right? So we can't just know. Here's the problems in that landscape. We need to help you prioritize this right vulnerability again, all because I have a CD in my environment. When I put that at scale, it's going to be hard to act on, right? I need to be able to focus on where is the biggest threat. Where do I need to spend my time, my resources, first? I need to get to those other things later. But where should my focus be? Right? All because I have a package on the system doesn't mean it's the most vulnerable. That package might not

be being used. The system might not be exposed out to the internet. There might not be a known exploit, right? All these things can help you identify when you have tooling in place, where do I need to focus on first and then ultimately, that resolved, right? Once that CD is out in public, we know that we have clocks ticking. Oh, that's our own security teams with the SLAs for us to go and address critical or highs, or whether that's time for those attackers to start to put it on the next slide, right? So what you'll see is Megan covers our roadmap. A little bit further in depth is all these are going to tie to those themes that are going to be crucial to making you be able to get through that life cycle. And so this is where Red Hat light speed, formerly known as Red Hat Insights, comes into play, right? This is how our solution help you identify, resolve and address those life cycles across your Red Hat program, as I mentioned, Route, open chip, Ansible, there's various set of tools that are available to you today, and what you're going to find is these themes are focusing on these core values and these pillars that we have, right? It's going to be consistency, security, troubleshooting or cost, right? These are the pain points that when we talk to our customers, who continue to hear whether they're not able to keep up with it or they're spending too much time on it today. And really one of the differentiators of this is a lot of these solutions are powered by the intelligence that we have as Red Hat working with new customers, right? So these are data that's coming from cases or known problems, right? These are challenges that you all are running into, and we're trying to say, be right into this. Let's make it so that you're aware of this as well, right? All of this is included within your subscription. If you're already a rel user, if you're already an open ship user, it's available for you, right? A lot of this is just how you put these tools into actions. This is an extra thing that you need to buy. It's there. It's needed to make sure that build brand ad experience with our products is optimizing. Like I said, a lot of folks actually don't know that this is part of their subscription. Why I want to hone in on that point. And there's a whole list here of what I'll consider tools or services that are available you don't need to use them often, right? Sometimes we find there's a specific tool or specific need that helps makes your life easier, right? All of these are available for you to use, onboard, back, etc, whether that's vulnerability management, addressing, prioritizing, CDEs, whether that's advisor, which is looking at the Red Hat support case data to find misconfigurations within the environment, compliance keep up with regulatory compliance and those needs as they continue to evolve. Or cost management. How do you track costs, especially as it starts to deploy at scale? All this is available to you within our hybrid cloud, console or console, but also, as of last year, we do have a on prem solution via satellite. As we know, some customers are not able to adopt SaaS. Want to keep things in their environment, whether that's disconnected, whether that's due to regulatory whether that's due to geographical nature. You're trying to make sure that you have the intelligence from Vice speakers in the solutions. So before we dive a little bit deeper into where we're going, I just want to highlight a few things specifically that we released over this past year that may be of interest. Here. We have an image developer service that you probably saw on that previous slide that's really helping you build a footprint for you be able to deploy relevant faster cloud. We understand that compliance needs continue to grow, so we've brought a lot of those compliance capabilities into inflows that you from the beginning, can start to track and make sure that that aligns to that regulatory AI ML is a pretty popular topic right now, as customers are starting to adopt AI workflows, and we've released an MCP capability that you can see actually on the Jacob Hall as well as we have a few labs that are received to get hands on. So now you can start to build that into your AI workflows. Or if you're adopting agents, give agents access to this tool. We also understand that customers don't necessarily want to adopt yet another tool, right? Sometimes that can be a pretty burden, a pretty large burden to adopt. Sometimes that can also be a pain to get through your security approvals. So you might already be using things like ServiceNow, we're continuing this theme of, how do we get data out of all our tooling into your workflows so you can actually go and operational etc? One remediations, as I mentioned that those core pillars, one of those is act.

We have a whole capability that's focused on, how do we make it easy for you to go and actually put these into action, whether that's through cancel automation platform, satellite, we understand sometimes navigating these can be a challenge, and we spend a lot of time building the tooling to make it easy for you to get going and act on these. And the last area here is workspaces, right? Especially as you start to use an end to next scale, you have a lot of systems organizing those systems can be kind of done. So how do we make sure that you have the controls, whether that's organizational buckets, whether that's our back, so that your team can really focus on the areas that they need to be focusing on so they get accurate results in those areas. I'll pass it over.

S

Speaker 2 11:08

All right. Thanks, Rob. All right. Let's talk a little bit about the themes that we are going to address over the next few years. So we'll be talking over 2026, 2027 really core, four core things, agentic management. We're moving from a world where you are piecemealing your response to you're really conversationally crafting the response to incidents and efficiency gains augmented context. So not only are we allowing you to interact with our tools via AI, but we also want to help you within the tools themselves, get more context about an issue that we found or security vulnerability that we found. On Premise management will continue to be a huge theme for us. We were here last year at Summit. We talked about our first iteration of insights going on premise with advisor. You'll see here in a minute, we have a full roadmap of more tools going on premise and then finally, enhanced security. We know that the world is ever changing. Our products are changing with it, both on the inside as well as the products that we offer to you. So let's start with the theme of agentic management. Just quick poll of the room. I'm curious how many of you are using MCP or something like that to connect, even if it's not to write out those connect to tools to help sort of fuel your operations today. How many of you are starting to use AI for businesses, just for basic efficiency, helping you write Word documents, helping you write emails, that sort of thing. How many of you are avoiding AI like the plague? I feel like that. Answer me. I probably would have got a few more hands last year. So that's good. We want to meet you where you are when it comes to AI. We know that the world is changing. We know that you may not, in the future, be coming to console or to satellite when you start to navigate your problems. You may be going to Gemini, you may be going to cloud code. And so it's important for us that we make the valuable data that we have in Red Hat light speed available to you via MCP servers. So we will continue to invest in that, not only if you're using our hosted solutions, but if you're using our on premise solutions via satellite,

you'll also be able to get information from our MCP servers. Agent skills will help remove complexity and streamline token usage. So right now, if you go just a very basic MCP server, you really just wrap the API. But what if the model is not using that API in the most efficient way? That is where you get tons of token usage start to run up your bills. Skills are going to help your models use our tools in the most efficient way. That not only means that you will be using the right tool for the job, but that you will be downgrading that token usage and hopefully some of those bills. And then finally, we at Rednet are committed to testing and sort of recommending which models to use with our different tools. What we hear from our customers time and time again is that they want our advice on these types of things. This is a new world for all of us. As you saw on the keynote today, Red Hat has jumped both feet into this pool. We've done a ton of this investigation internally, and so we will continue to advise and sort of test these models with our solutions to make sure they're working efficiently, and tell you which ones we think you should use augmented context. So I mentioned a little bit earlier about how we want to use AI within the product itself. One important example here is that Red Hat lights youth is using generative AI. This is coming out in the next couple of weeks when you get a malware hit, chances are you are not a malware expert. How can we use AI? And we will be using AI to give you more information about that malware. What is it? Where did it come from? How much is it being exploited? How much do you need to worry about this. We know that the vast majority of our customers are system administrators, but they're getting very security, security oriented results from us or our vulnerability and our malware services. How can we help you understand those and understand the criticality of them a bit better? We'll be using AI to help us do that. Another huge theme, as I mentioned, is on premise management. We will be increasing the analytics and security features that are going into our on premise tools, both on the REL side and the OpenShift side. I'm curious how many of you are rel admins in this room, or rel focused in this room? How many of you are OpenShift focused? I think I would have got a different answer last different answer. Last year, too good to know. So on the REL side, we have really focused on satellite. If you want to use our services on premises, you already have a premium trailer in which to do it. On the open chip side, we'll be introducing our on premise services via ACM, so your ACM user is going to work stronger, better, faster within that tool. Again, we want MCP access to work seamlessly alongside those tools. So today, we have MCP server for our hosted Red Hat light speed services. We're going to expand that to work on premise as well, and then specifically, really all over the business we were tackling. PQC, we're doing a ton of this, if you sat in a satellite session over the next six months within satellite specifically, but we understand that our on premise users are some of our most conservative users, and we have a dedication to making sure that's safe and secure. This rolls mostly into my next slide. So any given security inside and out, we'll be pursuing some certifications that will hopefully help our customers scoop ill at night. So the ISO 42,001 artificial intelligence system management certification, this is just a nod that we know that your compliance standards are going to change. We want to keep up with them. We're going to be doing a ton of investment in post quantum cryptology, cryptographic sorry, over the next year, both are hosted and on solutions. We'll be doing all of the things under the covers so that we are PQC ready. And then this screenshot that I have here is actually showing a partnership that we have with CrowdStrike, so released just last week or the week before. If you're a CrowdStrike customer and you're a Red Hat Lightspeed vulnerability users, you can see those results alongside each other. What we hear again and again from our customers is that I'm getting a ton of alerts I come to Red Hat light speed to help me understand, is this really impacting my host, or do I have something closed that makes me not run? Awarded this so soon, you'll be able to see CrowdStrike malware hits right alongside your IBM exports malware hits. We're going to continue to work with partnerships like this, where we know we had a ton of crossover in our customers. Okay, so those were the themes of the roadmap. Let's take these sort of let's double click on some of these, look at them on a timeline and dig into some of them. So we sort

of split up this conversation in terms of Red Hat OpenShift and Red Hat. Red Hat, Enterprise Linux for our OpenShift customers, this one's for you. Tons of focus on our cost management tool. Anybody here using our cost management tool and OpenShift, what we hear from our customers is that, you know, things have changed. I no longer have a centralized IT department that controls all the costs for my business. These are my application teams. Each of my project teams are sort of racking up their own bills. I need a way to charge back, look back on those costs, and that's what our cost management solution is doing. So in cost management, we will be doing efficiency scores. They'll do a plugin within Red Hat developer hub that will show your developers who are making some of those pod level allocations. It will show them what type of cost decisions they're making so that they can be more responsible upfront. We also have something that we're referring to as pen drive. So pin drive is for our telco customers who are truly disconnected. They're working on far away cell phone towers. Getting diagnostics out of those tools is incredibly important to them. So working on that, I'm going to double click on a little these specifically cost management so on prem cost management for OpenShift. This will be coming on prem. Until now, you have had to sort of send your data to our hosted solution for us to process that data. We will be doing a self managed or an on prem solution. This is sort of launching this summer. You will be able to control your costs, view your costs, view your resource organizations without sending any data. This will also have integration into ACM, so down the road, you'll be able to use this type of information alongside things in ACM, like policies and quotas to help sort of mirror all of those concepts together. We'll also be doing focus import and export, which is a finops standard for compliance, so getting data out of the system in a way that works for your business, and then obviously charge back and show back at the service unit level. Okay, let's talk a little bit about the REL roadmap for Red Hat light speed. We're hat light speed. Red Hat light speed. Expanded use cases, as we talked about, agentic management will continue to be a huge area of focus for us. We just released the CrowdStrike rules so you can now see CrowdStrike VR recommendations for malware alongside our IBM exports recommendations in the second half, our NCP server will go into GA. This brings you all the good things of GA. We'll talk about that a little bit. And compliance in early 27 will be coming into satellite. So for my satellite users in the room, you will now get the benefits of Red Hat light speed compliance within satellite in an offline mode or connected mode, if you prefer so. Let's double click on a couple of these MCP server enhancements. The big news here is that you will get GA level supportability on these we are now saying that this is ready for your production environments. We launched this in fall of last year under developer preview, sort of just gaging our customers interest in it, but we are now fully staffed, fully supportable. We are also adding when it comes to use cases, we're adding the compliance use case. So let's say that we're in the chat with Jim and I understand all of the servers that are in and out of compliance with the different business risk is you can now have that all in a conversation with Gemini or chat GPT or whatever your model of choice is a client of choices by using our MCP, we'll also be adding our planning use case. So this is the our Red Hat light speed planning tool is what tells you which of your packages are in and out of support. So you'll be able to have all those conversations through your favorite AI experience as well. All right, Red Hat Satellite integration, again, we talked a ton about insights on

Agentic Management

Analytics meet you inside your favorite chat assistant, using your preferred models.

Augmented Context

AI gives users in-app context about a recommendation, limiting time needed for investigation.

On Premise Management

Analytics and security tools are embedded inside your on premise management tools, without data transfer to Red Hat.

Enhanced Security

Red Hat continues to invest in the ongoing security of our products, readying them for PQC and certifications.

Agentic Management

Moving Toward Autonomous Systems

Red Hat Lightspeed hosted and on premise data will be accessible through MCP servers.

Agent skills will remove complexity and streamline token usage.

Red Hat will consistently test and recommend models for best experience.

Augmented Context

From Findings to Understanding

Red Hat Lightspeed will use generative AI to help users understand security related context for Malware found on connected hosts.

On Premise Management

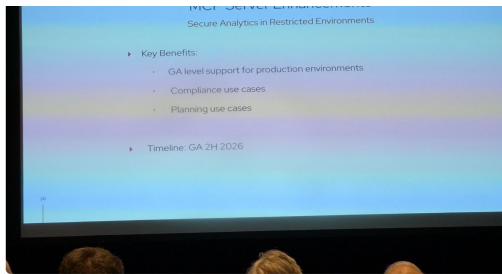

Secure Analytics in Restricted Environments

Increased analytic and security features will be accessible within your firewall.

MCP access to Red Hat Lightspeed will work seamlessly alongside your Satellite and RH-EL MCPs

Security standards like PQC will be implemented and ready for the most conservative use cases.

Enhanced Security Inside and Out

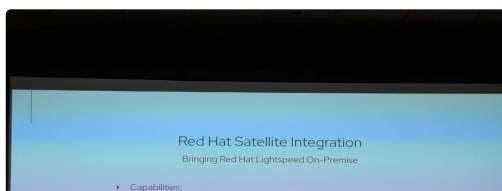

S

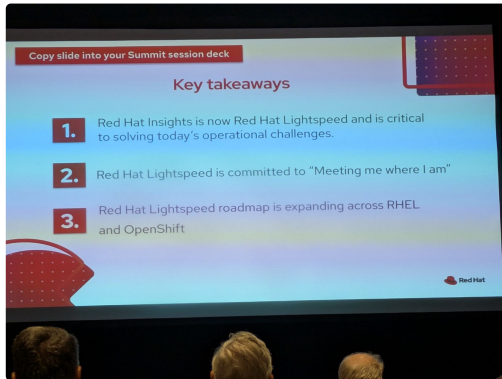

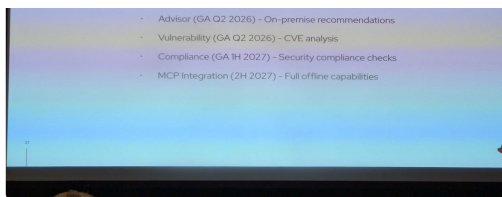

Speaker 4 23:00
premise.

S

Speaker 2 23:03

Or ran at light speed on premise, sorry, through satellite advisory GA in around this time last year, vulnerability is going GA right now. We just released satellite 619, compliance will be into availability this time next year, and NCP integration will be into GA this time next year as well. So we will be not only will we add in compliance, but we will continue to sort of go down the roadmap and add more and more of our app LT capabilities into satellite. So the main thing that we want to take away from this session here, we know that you have very complex operational dilemmas that you're dealing with. Your world is getting much bigger. It's getting much more diverse. You have assets in cloud. You have assets on prem, Red Hat. Lightspeed is here to reduce the complexity of those things help you prioritize the thing out of there. And Red Hat Lightspeed is really committed to meeting you where you are. If you want a conversational experience through an AI tool like Gemini or any of your other ones, we've got MCP servers value if you are married to satellite or ACM and really want to experience Red Hat through there. We are coming to those tools to meet you where you are. And we also have tons of integrations with Quantum Service now, and teams and all these other things as well. And then finally, Red Hat, right speed loaded now is expanding across rel and OpenShift. So whether you're a rel user and OpenShift user. We have tons of stuff coming this year that it's going to be great value. Okay, last thing I want to talk about, every year, we invite folks in our room to join us for feedback. We would love for you to be in what we refer to as our Demo Series, or part of our user research panel, we maintain a group of maybe, I think, 10 or 12 customers whenever we're developing something. These are the customers who here. At first, they tell us if it's a dud or if it's something that we like. So this is a way to really shape the roadmap of Red Hat Insights. If you're interested, we would absolutely love to have you, no matter if you're a ground user or internship user, or if you're looking for just a very quick bit of feedback, you can also be on our user research panel, which is a little bit more short. I'll leave this up here, but I'll go ahead and open up the open up the stage for questions. Stage for

S

Speaker 5 25:46

questions. Any questions? Yes, please. The MCP stuff on the second half of the year, the light, I guess, the question I had, and I'm trying to remember now the hosting of it. Is it, where? How, where will that MCP server live? And how do I get connected to it? I guess so. That's

S

Speaker 2 26:03

a container that you will download and run on your laptop or your own environment. We do not have a hosted MCP server that we host for you to connect

S

Speaker 5 26:13

to. Okay, but how does it get then, how does it get back to the light speed the light speed insights? Basically, you'll enter

S

Speaker 2 26:18

your credentials via a service account, and that will access one side inside, so as long as that server or laptop or whatever has a public internet

S

Speaker 5 26:33

connection, and I guess my existing OpenShift deployments, like Azure Red Hat OpenShift or Rosa. Those are already providing the telemetry to insights today. So then, I guess once this happens, then I can do all of that. Yeah, this is really just

S

Speaker 1 26:51

about

S

Speaker 2 26:51

taking that data, that Red Hat Insights we already has, and making it available to you through a different interface. So you don't want to come to the portal, you don't want to use it for other integrations, you can use the chatting experience. Yes,

S

Speaker 6 27:07

please. Is there a way to I'm not sure if it's so. Problem is I need to, I guess.
